

Message to the Youth

Anna Bacchia

There was a time on Earth - the so-called pre-verbal time - when men had not yet developed their verblity, and did not communicate with each other in words. Then an extended evolutionary period developed the so-called verbal era, in which languages were born. These substantially changed the relationships between men, the way they communicated and understood, and the whole of human life on the planet changed radically.

And today we find ourselves living in an era of transformation so radical, similar to the one that transformed the preverbal era into the verbal era, and similar to the great evolutionary transformations that marked the history of humanity on this planet, from the era of graffiti drawn on caves, to the web. And the interpreters of these processes are us: men born in these years, and you young people, who are creating the future.

Today we are evolving from the era of efficiency, to the era of an expanded consciousness of the life that we are. And we are all called to found a cultural and social context, and a mental and thought structure, not based on functionality, but on life. In a historical and evolutionary moment like the present one, the responsibility for the evolution of life is, as never before, in the hands of man.

Today even the most advanced frontiers of science lead us to recognize that the nature of all that exists is not coherent with a fragmented vision of reality, defined as the sum of separate and distinct entities, but is an undivided essence: which is life itself, the life we are. Where our breathing is nothing other, or separate, or divided, from the breathing of life itself. And in the stream of vital phenomena, the flow of emerging events always leads us towards life, towards that path that everyone is ready to create with his conscious presence.

Each one of us is endowed with natural attitudes and qualities, capable of bearing its own fruits. Like every plant on earth, it offers its fruits. And the consciousness of the life that we are, is the essential input that every day activates in us the discovery of what we are brought to create: giving shape to new, expanded, vital perspectives and solutions. Life, where the rhythm of the heart of the living beings is not 'other' or 'distinct' from the rhythm of life in the galaxies, also manifests itself as a field of infinite latent possibilities, waiting to be grasped and brought to light by our awareness, by our human sense of wonder, by our ability to be amazed and transformed, by our yearning to understand and discover, which is alive in everyone, always, without limits.

Given even the modern theories of complexity, today we know that in the complex reality in which we live, where everything is interconnected, even the slightest change of a minimum variable, can generate enormous variations in the entire life field. And in this context, we are called to recognize that our presence, our awareness, our

own thoughts constantly create an imprint, inform, influence and literally transform the field of existence and information in which we are immersed and of which we are made.

The invitation is to be aware of the life which we are.

And to never stop grasping and expressing what we dream of: that creative and vital input that inspires us in our depths, which is an expression of our most essential self. And the invitation is even to perceive and follow that which wonders and amazes us, which speaks to us about us, and leads us to know ourselves, as it resonates and reflects essential qualities of our nature.

What inspires us and leads us to intuit, to explore, to discover, to create, since ever, since we came to light, does not cease to offer us the energy that leads us to give shape to new answers, to discoveries, to enlightening solutions, to those expanded perspectives that we all yearn for.

Natural processes, and the vital intelligence that transforms and renews life in microorganisms as in the cosmos, teach us that in the process of life, the existence of goals is not the premise for its development. Rather, every result is *the consequence* of the ability of the living to *respond sensibly to vital inputs*, to be *transformed* by them, and to *follow* them with a coherent intelligence.

Every *vital* goal therefore does not consist in itself in the achievement of a set objective, nor is it intrinsic to impelling rhythms created for the purpose of achieving performances or productive interests of any kind.

Instead, each *vital* goal or result reveals itself to be *the path* itself: with the *intellectual and operational qualities and modalities* with which the goal is pursued.

Tuned to this context, even a recent UN program has proposed a new training model that prepares students "not for good grades, but *for life*".

In the flow of *life*, the goal is the *path* itself. And the goal does not consist of a 'thing', a quantity or a product, but is the expression of *how* man's intelligence and *the consciousness of life which he is*, manifest themselves. And how man intuits, follows and gives form to the information emerging from the field of existence. It is in this way that projects and creations can express the excellent and unequivocal *quality* in the *vital* achievement of a goal.

Today the cultural and thought structure in which we live implies techniques, protocols, logical models that codify and define vital processes, for diagnostic, functional and productive purposes.

But as in music, any model that defines it, is not coherent with the uniqueness of musical harmony that breathes in nonlocal extensions, that is, with the invisible and radiant vital symphony along its flowing.

What model could ever represent or define human life, infused with the living intelligence, as rich and fleeting as reality itself, which *generates the flow of life*?

And what model could ever imply the flowing uniqueness and the marvellous constant evolution of a man, continuously recreated and regenerated even by his every interrelation, thought, wonder, yearning, need, question?

The *forma mentis* that develops functional logic, methods, algorithms, computer science, has even compared the intelligence of man with the AI of computers.

But in such context the substantial misunderstanding consists:

- both in identifying the meaning and the goal of such comparison in the *result* achieved by a *living* intelligence, put in relation with an *artificial* intelligence, as for example the evaluation of the chances of winning in a game of *Chess* or *Go*.

- and in making AI the measure of living intelligence: on the contrary, there is no program that can include all the answers that a man can express in his interrelationships with *life*. Such misunderstandings therefore disregard the *vital* intelligence inherent in man:
- in his *modality of expressing himself as a living consciousness* in daily vital interrelationships.
- in the everyday *experiences* where even every thought constantly re-creates the person
- in the *intelligent* intuiting and responding to the nonlocal *eloquence* of the infinite information *emerging* from the field of existence: an eloquence that constantly inspires the entire *evolution of life*.

The constant daily questions and challenges that emerge - as Einstein argued - do not find solutions in the spatio-temporal dimension of problems.

Latent evolutionary possibilities and *vital* solutions breathe in and emerge from nonlocal extensions of existence.

They are grasped by awed men, aware and awakened by the spark of life inherent in the human being, and by the grandeur and eloquence that the whole reality manifests. It is that spark that constantly transforms and regenerates us, arouses new questions, expands the yearning to understand, and engenders cosmic expansion.

In the great need for transformation in this new evolutionary era of human history, it is that spark that leads us today to begin from ourselves:

- to become conscious co-creators of the evolution of life on the planet,
- while it entrusts fully in our hands the transformation of the culture of models and functionality, into a culture of life.
